Customer:	Jeyes
Location:	UK-wide
Industry:	Manufacturing
Challenge:	Bandwidth availability and reliability
Solution:	Fully-managed MPLS WAN
Results:	Unequivocal and scalable solution, providing VPN access to international sites and suppliers

THE CHALLENGE

Founded in 1877, Jeyes are a leading manufacturer of cleaning and hygiene products, operating from six UK sites and five international sites.

They were experiencing bandwidth availability problems at their Head Office with their existing Wide Area Network (WAN) service provider, and found that the network lacked reliability.

Jeyes needed a resilient and scalable solution for extending bandwidth to their other UK sites, whilst also providing VPN access to international sites and suppliers.

"GGR's extensive technical expertise ensure that we had the best possible team in place to implement our full WAN changeover. Our infrastructure is now fully supported by GGR and we receive a high level of customer and technical service from them. I would strongly recommend GGR Communications to anyone."

> Stuart Clarke, Group Network Manager, Jeyes Ltd

THE SOLUTION

GGR implemented a new managed MPLS WAN, which connected all of the sites into the Head Office using best-in-class Cisco hardware.

A new high bandwidth access circuit was installed at HQ, allowing Jeyes plenty of capacity for the forseeable future and the flexibility to increase it significantly at short notice.

In addition, all other UK sites were connected to the MPLS cloud, and internationsal sites were connected via Internet-VPN ensuring high speed connectivity at minimal cost.

THE RESULT

Jeyes now have a fully managed MPLS WAN with a single point of control and, importantly, sufficient bandwidth for their future business requirements. The UK sites now access the Internet via Head Office, providing a single point for security policy enforcement and management.

Jeyes also have a fully automated backup at all sites, ensuring business continuity should they lose connectivity via the primary link.

GGR fully manage this network remotely, 24 hours a day, every day.

BENEFITS

- Proactive end-to-end management
- Converged network implementation and migration
- 24/7 maintenance and fault management giving peace of mind
- Expert industry knowledge giving best practice solutions, tailor-made to the client
- Scalable future-proof solution.
